

# QA Analyst Project

Bruna Gabriel

## 1. What questions would you ask in order to clarify requirements?

- Is the email in the right format? And if it already exists, what happens?
- Are the same usernames allowed?
- What happens if there aren't 6 characters or if there are more than 30?
- What happens if one of the fields is empty?
- What happens if the email with the temporary password doesn't arrive? Is the user still active?
- What happens if the temporary password is not changed within a short period of time? And is there a time limit for changing it?
- Can the user update the password and keep it the same as before?
- Are there any criteria for the new password? For example, does it have to have at least one capital letter and one number?
- What happens if the password is lost? Does it block access after a few attempts? Or does it show clues that the user has previously established?
- What happens if creating a user takes too long?

## 2. Specify 5 test cases to test this requirement

- Validating the email format
  - Example: John.doe.com → should display an error message saying that the intended format is xxxx@email.com
- Validation of the length requirements
  - Example: first name has 35 characters → should display an error message saying that the number of characters has been exceeded
- Check if the user already exists
  - If it already exists, a message should be displayed saying that the chosen user already exists.
- One of the three fields is empty.
  - If the user doesn't fill in one of the fields (email, first name or last name) → display an error message saying that all fields must be filled in.
- The user's creation time has been exceeded
  - If the user has not created and validated the account in the stipulated time, a message should be displayed saying that the time has been exceeded.
